

1. Solar panels may only be mounted on the roof of a structure. It is unacceptable to mount them on the ground (lot sizes are too small to permit that) or hanging from the roof or attached to the side of a building.
2. Solar PV (photo voltaic) panels must be installed by a licensed contractor, specifically certified to do Solar PV installations in the state of Delaware.
3. Installation plans, including specific layout information must be submitted to the WPPOA ARC for approval. The layout of the panels must be orderly and not haphazard.
4. All installations must have a county building permit and pass all required inspections by both the county and the Electricity provider, Delaware Electric Coop.
5. All solar PV panels must be all black.
6. No solar PV panels should be mounted on the front of the house. If other roof surfaces are insufficient, the ARC may consider some front mounted panels.
7. All solar PV panels must be mounted facing a direction which will result in efficient usage of the solar electric panels. This would be a southern, southwest or southeast exposure.
